

TourGuide 2020 Sennheiser

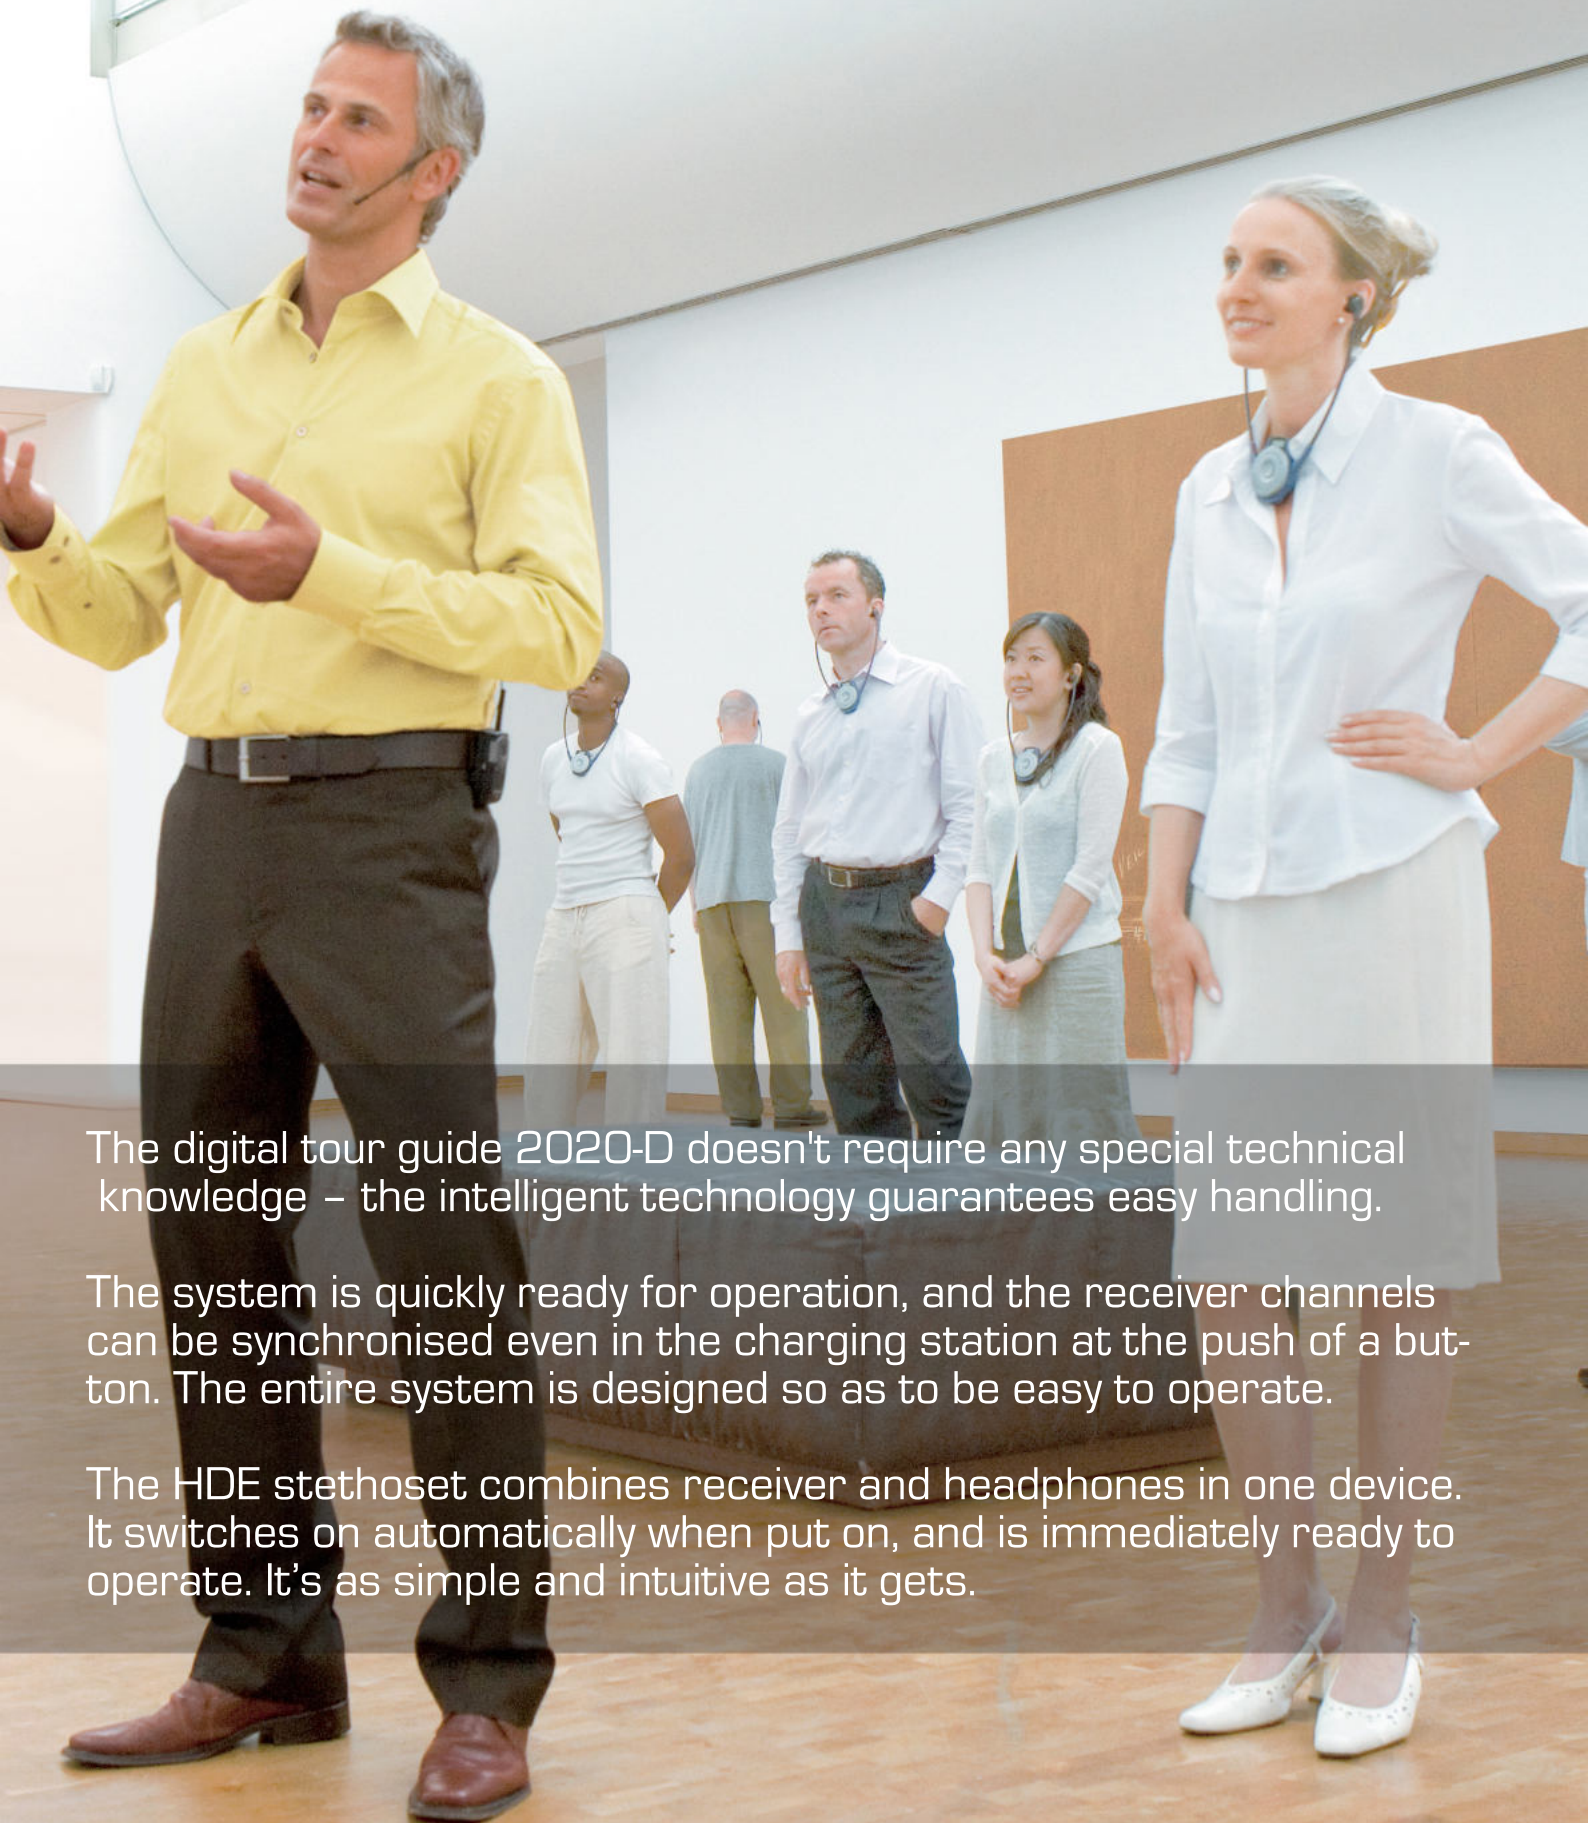

TourGuide 2020-D

Information becomes an experience. The very simple, quick and easy way to a professional solution for guided visitor tours, at conferences, and for assistive listening.

Simply more intuitive

The digital tour guide 2020-D doesn't require any special technical knowledge – the intelligent technology guarantees easy handling.

The system is quickly ready for operation, and the receiver channels can be synchronised even in the charging station at the push of a button. The entire system is designed so as to be easy to operate.

The HDE stethoset combines receiver and headphones in one device. It switches on automatically when put on, and is immediately ready to operate. It's as simple and intuitive as it gets.

Easier to understand

A man in an orange shirt and glasses stands in a factory, smiling, with other people in the background. The factory has a yellow metal structure and a white ceiling. A white van is visible in the background.

The Tourguide 2020-D operates within the licence-free ISM frequency band and is therefore extremely quick to set up, without any elaborate frequency planning.

Automatic functionalities make installation and operation easier still. If required, the system functions can also be individually expanded.

For example, the default settings of the frequency presets can be modified, and by means of a professional antenna management system, coverage can be further enlarged during stationary operation.

More flexible to use

Full flexibility for a diverse range of application scenarios: the Tourguide 2020-D is not only suitable for guided tours and interpreter applications, but also for assistive listening in theatres or opera houses; hearing aids can be easily connected.

The Tourguide 2020-D is also ideally suited for temporary use and the rental business.

The system is particularly quick and easy to set up and can be professionally expanded by accessories like a transport case with integrated charging equipment. Furthermore, flexibility for any application and requirement is provided by the headphones EP 01, HP 02, and NP 02, which have been specially designed for speech reproduction.

Components

Two versions of the receivers are available for purchase. Both receiver systems are equipped with 6 frequencies.

- 1: StethoSet receiver
- 2: Bodypack receiver

Components

Two options can be used for the transmitters.

Both transmitter systems are equipped with 6 frequencies.

1: Bodypack with neckband microphone

2: Handheld transmitter

The combined charging and transport case offers space for 20 receivers, 2 bodypack transmitters and one handheld transmitter.
